

README

File location: `$VCS_HOME/doc/examples/nativetestbench/openvera/rvm/host_if/README`

This example verifies a simple host interface on a DUT.

The physical interface is an Intel-style management interface, as defined in the Utopia Level-2 specification document.

The implemented registers are all 8-bits wide. Addresses 0 through 7 are read-only, where addresses 8-31 are fully writeable.

The classes defined in the "intel_mgmt" directory implement a set of reusable verification components. As such, they do not include DUT-specific functionality or information.

The classes defined in the "env" directory implement a verification environment for the DUT. Callback methods for the appropriate components are suitably extended to integrate the scoreboard and implement a relevant coverage model.

The programs defined in the "tests" directory are individual tests run on the verification environment using pure OOP extensions. The AOP version of these same tests can be found under the "tests_aop" directory.

To compile:

```
% make
```

To run all OOP tests:

```
% cd tests
% make tests
```

To run all AOP tests:

```
% cd tests_aop
% make tests
```
