

README

`$VCS_HOME/doc/examples/nativetestbench/openvera/rvm/restart/soft_stable/README`

This example shows how a verification environment can be restarted to perform two "tests" in sequence without resetting or reconfiguring the DUT in between, while preserving random stability across tests.

This approach would be used if it is necessary to minimize the time spent initializing the DUT for a series of configuration-compatible tests but requires the ability to run the same tests individually for debug.
